Funding from State of NM, BP, and National BLM Air Program

Oversight by western states, local air agencies, federal land managers, EPA regional and national offices

EPA national Ozone Standard

- Measured at ground station sites, highest 8-hour average each day
- 4th highest values each year are averaged over 3-year periods to determine compliance (e.g., 2007-09, 2008-10)
  - Statistic is called a “Design Value” for that site for that time period
- Current Ozone health standard level is 75 ppb
- EPA (re)considering revised Ozone health standard in a range of 60 to 70 ppb
- EPA also considering a secondary Ozone standard for ecosystem protection
  - Growing season / daylight hours-weighted cumulative metric

What are (some of) the sources and control issues in the West related to new Ozone standard(s)?

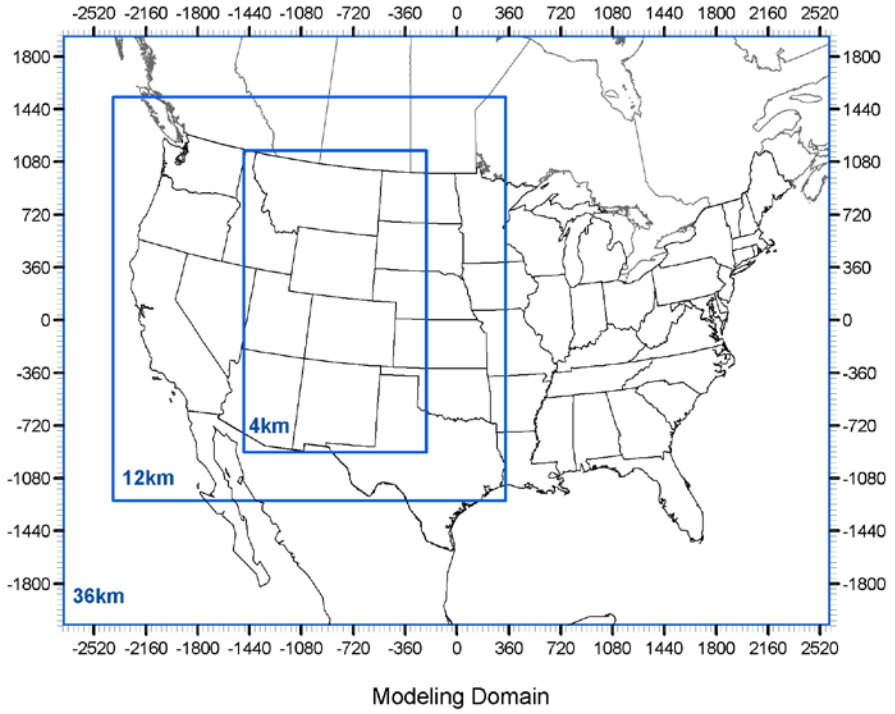
- Urban and rural reactivity
- Transport and formation – how much / how important?
- Public lands with large biogenic emissions and fire activity
  - How to characterize for effects of drought and climate variation ?
- Federal and state mobile fuel and tailpipe controls
- Upstream Gas NSPS rules in place in 2015
  - Industry practices changing rapidly, e.g., green completions
- Point sources (dominated by EGUs for SO_2, NO_x)
  - Significant NO_x BART by ~2018
  - Less coal-fired electricity supply due to climate change rule?
  - 17+ million acres of public lands leased in last 5 years for O&G exploration and production

Introduction

- West-wide Jump-start Air Quality Modeling Study (WestJumpAQMS) was initiated in late 2010 to:
  - Develop the next generation of regional air quality modeling databases for ozone, $PM_{2.5}$, visibility and deposition planning in the western U.S.
  - Provide information on the role of interstate and international transport to ozone and $PM_{2.5}$ under current and potential future NAAQS
  - Assess contributions of major source categories (e.g., point, O&G, mobile, et cetera) to air quality in the West
  - Provide detailed information to the community

Overview of Approach

- 2008 Modeling Database
  - 36 km CONUS
  - 12 km WESTUS
  - 4 km IMWD
- WRF meteorological; CAMx photochemical; SMOKE emissions models
- 2008 WRAP Phase III O&G emissions
- 2008 NEI emissions
- Model Evaluation
- Sensitivity Tests



- State-Specific and Source Category-Specific Ozone and $PM_{2.5}$ Source Apportionment Modeling

WestJumpAQMS Products

- Final Report
  - 15 Electronic Appendices
  - Response-to-Comments
- Ammonia Emissions Recommendations Memo
- Modeling Protocol
  - Response-to-Comments
- WRF Application/Evaluation Report
  - Evaluation down to individual monitoring site
  - Response-to-Comments

- 16 Technical Memorandums on Emissions
  1. Point Sources
  2. Area + Non-Road
  3. On-Road Mobile

  4a-e. Oil and Gas (5 geographic areas)

  5. Fire (WF, Rx & Ag)
  6. Fugitive Dust

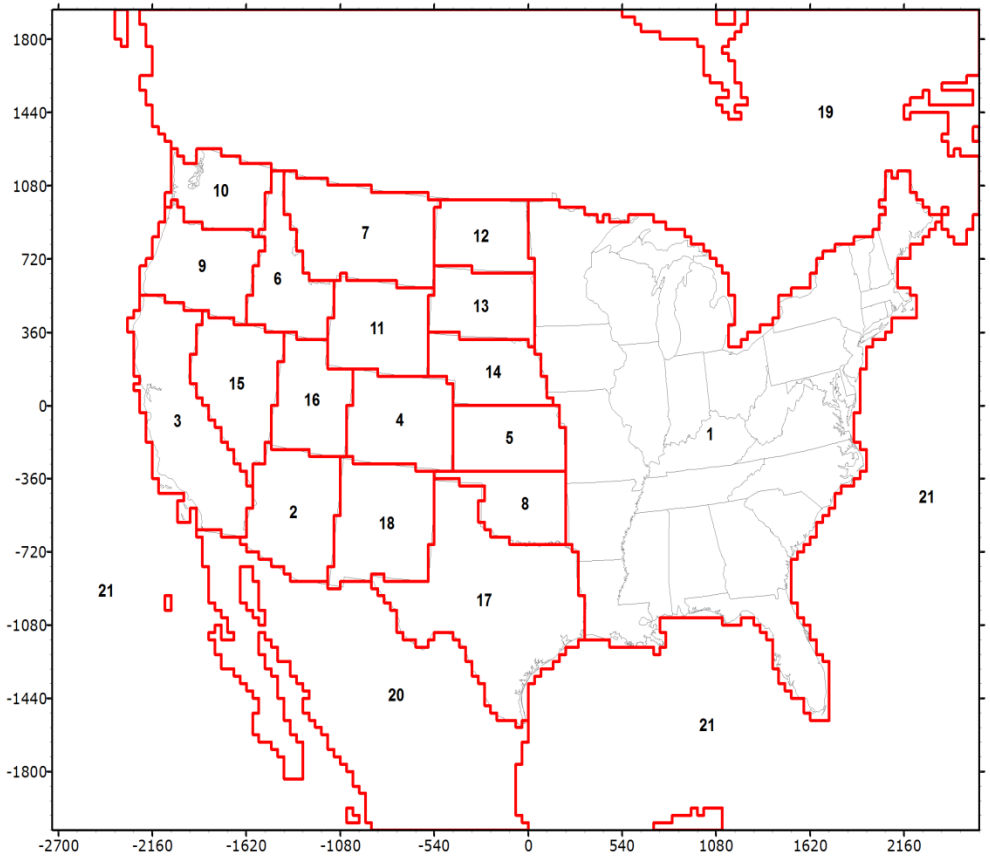
State-Specific Ozone Source Apportionment

- Purpose: To provide information on the role of ozone transport to exceedances of the current and potential future ozone NAAQS in the western U.S.
- Approach: Analyze ozone apportionment several ways:
  1. Upwind state contribution to downwind state nonattainment using Cross State Air Pollution Rule (CSAPR-type) approach
     - Use EPA method for projecting ozone Design Values (RRFs)
  2. State contributions to modeled high ozone DMAX8 ozone at monitors in 12 km WESTUS domain
     - Spatial extent of modeled state contributions to 1stmax and 4thmax DMAX8 ozone greater than current and potential future NAAQS
     - Source category analysis (Natural, Fires & Anthropogenic)
  3. Detailed Source Category-Specific Source Apportionment
     - 6 key source categories across 4 states in intermountain West
     - 2-way nesting between model domains

State-Specific Ozone Source Apportionment

- 2008 36/12 km Base
- 17 Western States
  - Plus EasternUS, Can, Mex & Off-Shore
- 5 Source Categories
  - Natural (Biogenics+Lightning+WBDust+SeaSalt)
  - WF, Rx and Ag Fires
  - Anthropogenic
- 107 Source Groups (21 x 5 + 2)
  - 4 Extra Species for each Group
    - 428 additional species
    - Standard Model = 70 species
    - Computationally Demanding



CSAPR-Type Analysis for current (76 ppb) and potential future (70 and 65 ppb) NAAQS levels

- CSAPR looked at contributions to:
  - Average Design Value = Average of DVs from 2006-2010
  - Max Design Values = Max DVs from 2006-2010
- 136 ozone monitors in 12 km WESTUS domain with Average Design Value exceeding 76 ppb NAAQS
  - 86 sites (63%) in California
- For 17 upwind western states examine 2008 contribution to DMAX8 ozone Design Value in downwind states
  - CSAPR used a 1% NAAQS significance threshold (≥0.76 ppb)
- This analysis is for 2008 and is not a regulatory analysis that would have to examine a future year

Spatial Distribution of State Ozone Contributions

- Spatial distribution of state's ozone contribution to DMAX8 ozone concentrations greater than or equal to:
  - 76 ppb (current NAAQS)
  - 70 ppb; 65 ppb and 60 ppb (potential future NAAQS)
  - 0 ppb (highest contribution in year)
- Two types of metrics:
  1. Maximum modeled contribution to Highest and 4th Highest DMAX8 ozone (from WestJumpAQMS Appendix C)
  2. Attainment Test Unmonitored Areas projection contribution to 8-hour ozone design value (not shown in this presentation)
- Examples for Nevada next:
  - Maximum contribution to highest DMAX8 ever and at 76 ppb (current NAAQS)
  - Maximum contribution to 4th high DMAX8 for 76, 70, 65, and 60 ppb

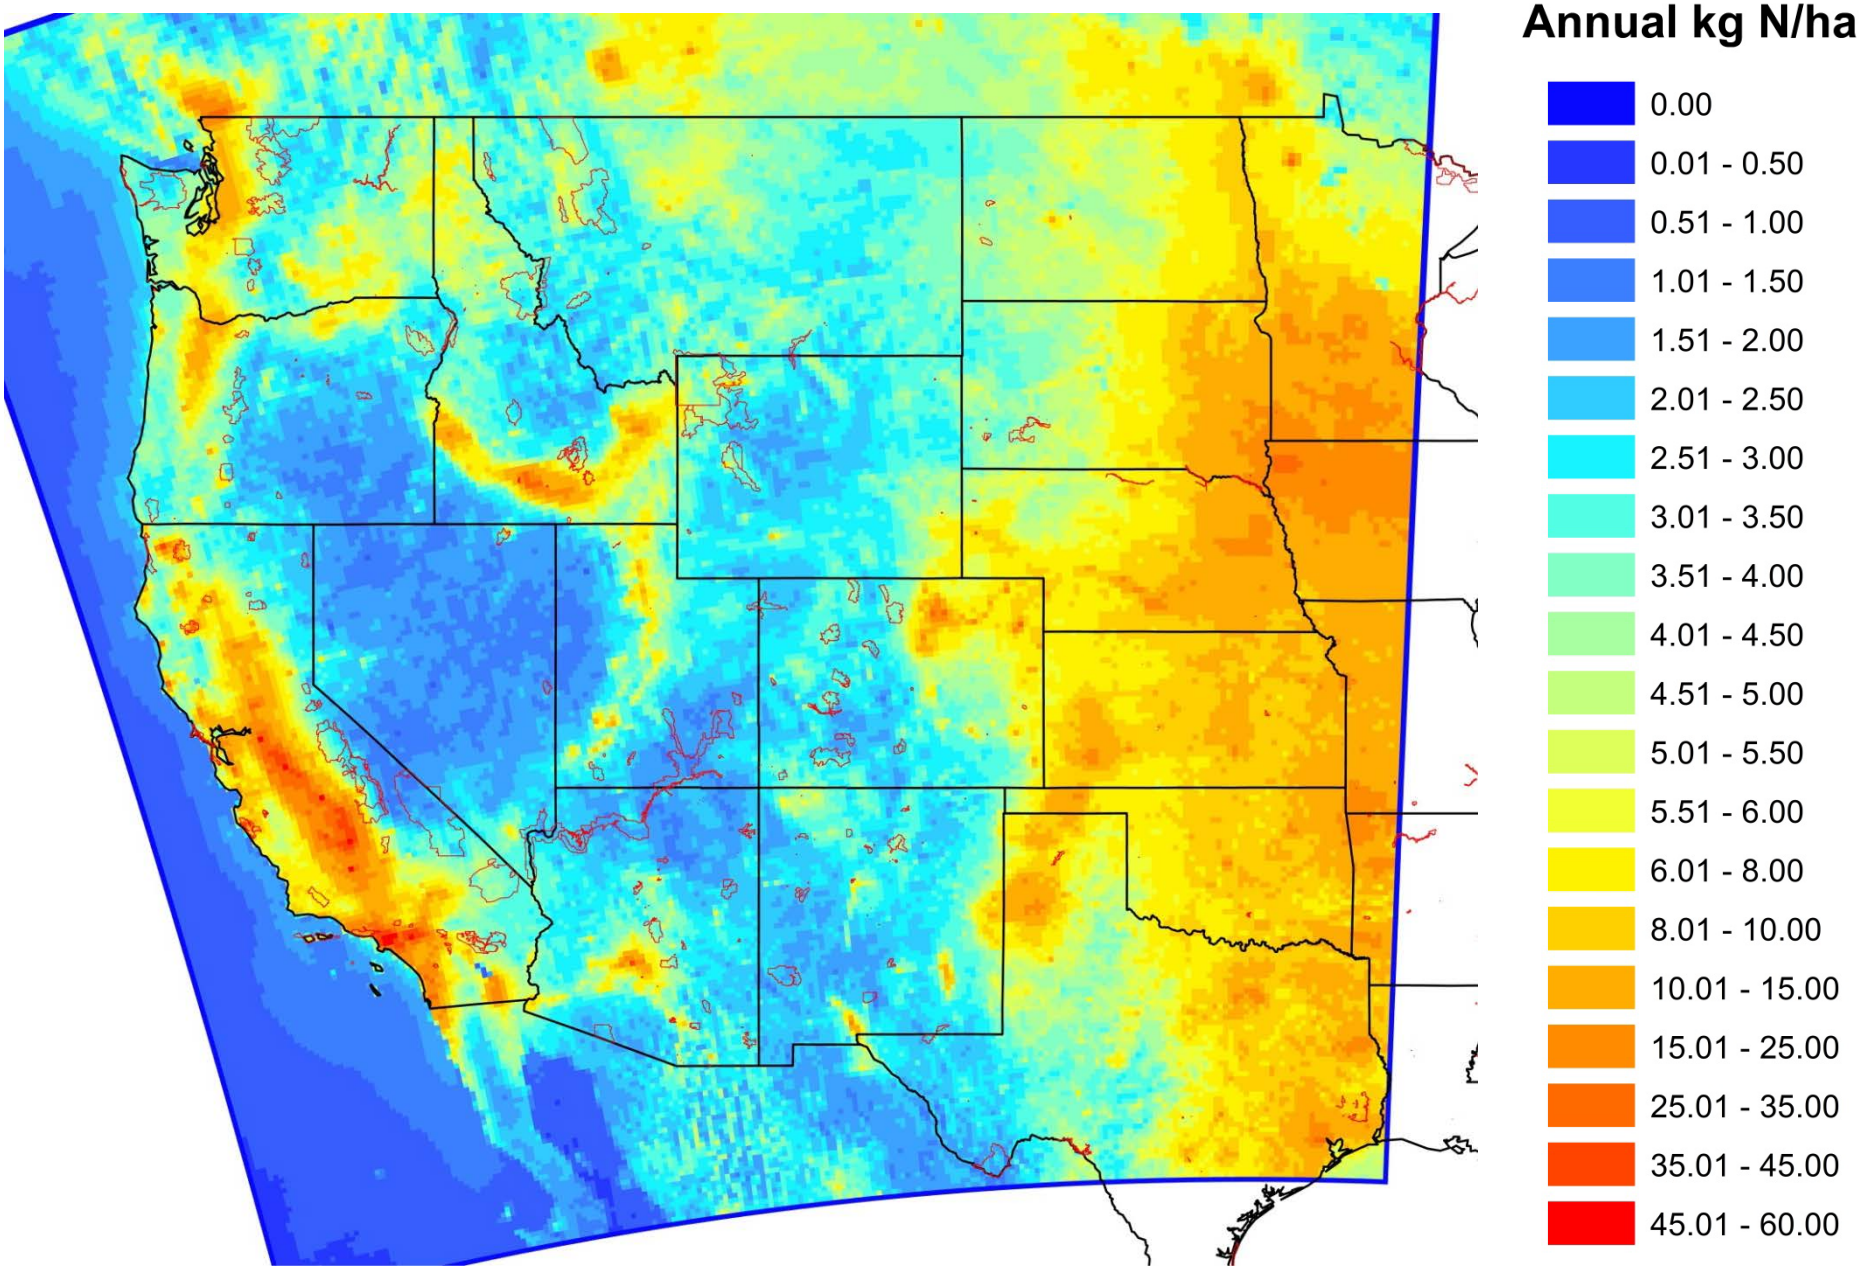
Summary of WestJumpAQMS 2008 Modeling Results for Nevada

- Shown earlier
  - Examples of Upwind Ozone Contribution to highest and 4th highest, and 10th highest modeled days at 5 monitor sites across NV (shown earlier, from Appendix B)
- Next
  - Nitrogen Deposition Analysis
  - Thanks to Tammy M. Thompson, CIRA, and Michael G. Barna, NPS for modeling results and slides

WestJumpAQMS Modeled Total Nitrogen Deposition



Class 1 & 2 Areas outlined in Red. Total N includes wet & dry deposition of all species.

Total Modeled Nitrogen Deposition Includes:

- Organic Nitrogen Species: PAN, RNO_3 (model chemistry includes organic N formed from biogenic VOCs)
- Dry Deposition Other Oxidized Nitrogen: NO, NO_2, N_2O_5, HONO, HO_2NO_2
- Dry Deposition Ammonia (NH_3)
- Wet Deposition Other Oxidized Nitrogen: NO, NO_2, N_2O_5, HONO, HO_2NO_2
- Dry Deposition of Nitric Acid (HNO_3)
- Particulate Nitrate (NO_3^-): Wet and dry
- Particulate Ammonium (NH_4^+): Wet and dry

Total Measured Nitrogen Deposition Includes:

- Organic Nitrogen Species: PAN, RNO_3 (model chemistry includes organic N formed from biogenic VOCs)
- Dry Deposition Other Oxidized Nitrogen: NO, NO_2, N_2O_5, HONO, HO_2NO_2
- Dry Deposition Ammonia (NH_3)
- Wet Deposition Other Oxidized Nitrogen: NO, NO_2, N_2O_5, HONO, HO_2NO_2
- Dry Deposition of Nitric Acid (HNO_3)
- Particulate Nitrate (NO_3^-): Wet and dry
- Particulate Ammonium (NH_4^+): Wet and dry

Nitrogen deposition measurement data is incomplete

- Chemical Transport Models (e.g., CAMx) capture the bulk of total Nitrogen Deposition (although CAMx is missing reduced organic nitrogen and includes limited oxidized organic nitrogen – both expected to be small)
- Many Critical Load values are estimated using measurement data, some with scaling factors to account for “missing” N, others incorporate modeling data, still others leave data as is with caveats
- Efforts to close this gap continue, including the creation, in 2010, and subsequent expansion of the Ammonia Monitoring Network (AMoN)
